About me

Note!
On this page there are instructions tested on children :)
Yes, I test them on children. I have been working with children since 2012. Every day I try to show them how interesting science can be, what we can achieve thanks to engineering, and that everyone can create art.
In my passion (work), I make use of Lego Duplo, Classic, Technic and Lego Wedo 2.0.
Creating instructions is my second passion.
I create instructions with children in mind because what may seem simple to us - teachers, is not necessarily that simple for our students.

On this page you will find instructions on how to build models from the Lego WeDo 2.0 set

Helicopter - it is an aircraft heavier than air (aerodyne), which generates lift force with the rotational motion of an engine driven rotor. Thanks to this, a helicopter can take off and land vertically, hover, fly forward, backwards and to the sides. These attributes allow to use helicopters at crowded or isolated areas where classic airplanes can not operate.

Additional tasks

1. Take advantage of the tilt sensor and program the helicopter so that it changes the speed of the rotor, sound, and light color when tilting forward, backward, right, and left.

2. Rebuild it so that instead of a chassis with skids it has wheels (minimum 3 wheels).
